

Our digital workforce takes the routine work off your teams.

So colleagues spend their time on the decisions that need them. How can we help?

**Ask a question**

About any automation, app, agent or this site. Reply in 2 working days.

**Report a problem**

Something isn't working as it should. Triage in 1 working day.

**Change something**

What it does, when it runs, or a system it uses is changing. Sized in 5 working days.

**Bring us something new**

A process or idea worth automating. Qualified in 10 working days.

This year in numbers

How we count value

What we can do for you

All capabilities

The diagram illustrates three use cases for Blue Prism digital workers, each represented by a white box with a red header bar and a light blue background. The boxes are arranged horizontally and connected by a light blue line.

- Take the routine work off your teams**
Blue Prism digital workers run high-volume, rule-based steps around the clock, across the systems your teams already use.
For example: rekeying transfer data between three systems.
- Apps and workflows for your teams**
Power Apps and Power Automate replace spreadsheets, email chains and manual hand-offs.
For example: referral trackers and approval workflows.
- Prepare the case, so people decide faster**
Coming next. Agents on Google Cloud will gather the facts and check them against our own data, so your colleague decides with everything in front of them.
For example: drafting the case summary for a complaint handler.

What we deliver

The value our automations hold today, where it lands, and what changed for the teams who use them. We count value only once an automation is live and measured, and stop counting it if it stops holding.

Data as at 6 October 2026 · refreshed daily from the estate. FTE means full-time equivalent: one colleague's working year.

How we count value

What changed for the teams we work with

Insurance

Claims triage

Before
14 min

After
2 min

My handlers start the day on decisions, not on sorting. We got back the equivalent of eight people without hiring anyone.

Pensions

Pension transfer checks

Before
3 systems

After
1 check

Transfers used to bounce between three teams. Now one check catches the missing documents before anything moves.

Investments

Investment KYC refresh

Before
12 days

After
2 days

Refreshes run overnight, so customers are not chased twice and we are never behind on the regulator's timetable.

Live in your area

Every live solution has its own page: what it does, how it is performing, its controls evidence and its change history.

Report a death	All areas	9	24k	£0.1m	Death claim notifications

Microsoft Power BI

How we count value

Value is colleague time returned: live case volumes multiplied by the time each case took by hand, converted at the blended colleague rate.

Run cost is everything it takes to keep the estate live, including our people, licences and infrastructure.

Cost per case is run cost divided by cases completed. **FTE** is full-time equivalent: one colleague's working year.

Why it lasts

Our Service Team runs every automation after it goes live. When the systems around it change, they fix it. That is why value reported last year is still true this year, and why we report it as a running total rather than a one-off saving.

37 specialists who know your processes and the platforms behind them.

Every person has one primary skillset. Together they cover the whole journey, from finding the work to keeping it running.

The skills we bring

Digital Worker engineering 15 people Build and run Blue Prism digital workers, the backbone of our estate.	AI engineering 9 people Agents, workflows and services on Google Cloud, built to prepare decisions, not make them.	Power Platform 6 people Colleague-facing apps and lighter automation with Power Apps, Power Automate and Dataverse.
Solution architecture 2 people Make sure every automation fits your systems, our controls and group standards before build starts.	Customer journey design 2 people Map the journey end to end, so we automate the right step, not the most visible one.	Integration and observability 3 people Connect automations to the systems around them and build the telemetry that shows how they perform.

How we are organised

Service Team (10 people) runs every automation after it goes live: monitoring, fixes, change and value measurement.

Four build squads (5 people each) take new work from your first conversation to live, each with one squad lead.

Leadership (7 people): engineering and product lead together, with architecture, journey design and integration around them.

Who to talk to

Diagram showing the roles of the eight team members:

- PO** [Name] Lead Product Owner
- EL** [Name] Engineering Lead
- SA** [Name] Lead Solution Architect
- CJ** [Name] Lead Customer Journey Manager
- LI** [Name] Lead Integrator
- PO** [Name] Product Owner, build squads
- SL** [Name] Service Team lead
- IN** [Name] Integrator

In their own words

I built the agent that drafts complaint case summaries. Handlers check and decide; they no longer spend the first hour gathering facts.

[Name]
AI engineer, Squad 2

When the claims system changed its screens, we updated the digital worker overnight. Nobody in Insurance noticed, which is the point.

[Name]
Digital Worker developer, Service Team

The referral tracker replaced four spreadsheets and an inbox. Team leaders now see every open referral on one screen.

[Name]
Power Platform developer, Squad 3

What we build is used within hero journeys, the division's priority customer journeys. These are the six things we are asked to do most, and the platforms we do them on.

The diagram consists of six rectangular boxes arranged in a 2x3 grid. Each box has a red horizontal bar at the top left, followed by a bold title, a paragraph of text, and a horizontal line with an example below it. The boxes are: 1. Top-left: 'Take the routine work off your teams' with text about Blue Prism digital workers and an example of rekeying transfer data. 2. Top-middle: 'Apps and workflows for your teams' with text about Power Apps and Power Automate and an example of referral trackers. 3. Top-right: 'Prepare the case, so people decide faster' with text about agents on Google Cloud and an example of drafting a case summary. 4. Bottom-left: 'Reusable services' with text about building business rules as services and an example of eligibility rules. 5. Bottom-middle: 'Keep what's live running' with text about the Service Team monitoring and an example of updating a digital worker. 6. Bottom-right: 'Telemetry and journey insight' with text about telemetry from automations and an example of measuring transfer request wait times.

Take the routine work off your teams

Blue Prism digital workers run high-volume, rule-based steps around the clock, across the systems your teams already use.

For example: rekeying transfer data between three systems.

Apps and workflows for your teams

Power Apps and Power Automate replace spreadsheets, email chains and manual hand-offs.

For example: referral trackers and approval workflows.

Prepare the case, so people decide faster

Coming next. Agents on Google Cloud will gather the facts and check them against our own data, so your colleague decides with everything in front of them.

For example: drafting the case summary for a complaint handler.

Reusable services

We are building business rules as services on Google Cloud, so every platform uses the same logic and a change happens in one place.

For example: eligibility rules shared by a digital worker, an app and an agent.

Keep what's live running

Our Service Team monitors, fixes and changes everything we build for as long as it runs.

For example: updating a digital worker when a system screen changes.

Telemetry and journey insight

Telemetry from our automations shows how the journeys they support are performing, so we can see where work slows down and improve it.

For example: measuring how long transfer requests wait between steps.

A customer journey passes through six layers. We build in the middle two, for use within hero journeys, and use telemetry from what we run to measure how those journeys perform and where to improve them.

Automated Operations Lab

Our part in the Automated Operations Lab.

Automated Services is one of the teams in the Automated Operations Lab. The Lab's own site covers its full programme; this page covers what we are building for it, inside our own team and budget.

[See the Lab's full programme and every team on the Lab site](#)

Three rules we don't bend

Agents prepare, people decide

No agent makes a determination about a customer. It gathers, checks and recommends. A colleague decides.

Prove it before it goes live

Every new agent is tested against real cases and compared with what actually happened before it touches a customer.

Build once, use everywhere

Capabilities like checking a customer's details or drafting a letter are built once and reused across journeys.

What's coming

● Working today

Task mining

Shows us how work is actually done on screen, so we automate the right steps.

● Being built

Better telemetry

Richer telemetry from our automations, so we can measure the journeys they support and find where to improve them.

● Being built

Process map drafting

A draft process map from the meeting where a new process is designed.

● Being built

Reusable services

Business rules moved out of individual bots into shared services any platform can call.

● Being built

Estate dashboard

Performance and cost of every digital worker, on one page.

● Next

Agent shadow testing

New agents run alongside real cases, unseen, so we can compare their work with what happened before they go live.

What we need from you

A hero journey to measure

Name a hero journey your automations support and we will help measure where it slows down and what would improve it.

[Talk to us](#)

A process still being designed

Bring the requirements conversation and we will draft the map before build starts.

How can we help?

Four ways in, whatever the automation, app, agent or service. Each one opens a short form, and you can follow every request you raise in "Your requests" below.

Is a live automation stopping customers or colleagues right now? Raise an incident in ServiceNow to **IA-Automation-Support**. That reaches our on-call engineer straight away.

Raise an incident

🔍

Ask a question

About any automation, app, agent or this site. Reply in 2 working days.

⚠️

Report a problem

Something isn't working as it should. Triage in 1 working day.

↔️

Change something

What it does, when it runs, or a system it uses is changing. Sized in 5 working days.

💡

Bring us something new

A process or idea worth automating. Qualified in 10 working days.

🌀

Not sure which route? Ask the CCS agent.

Describe your process in a sentence or two. It checks what we already run, sizes it roughly and starts the right request for you. A person still decides.

Ask the CCS agent

Your requests

Request ▾	Type ▾	Solution ▾	Status ▾	Raised ▾
Claims bot skipped cases with a missing policy number	Problem	DW-Claims-01	In progress	29/09/2026
Run the KYC refresh overnight instead of 9am	Change	DW-KYC-03	With us	01/10/2026
Death claim notifications	New idea	–	New	05/10/2026

You only ever see the requests you raised. We update the status as it moves.

What happens next

1. We read it

and route it to the right squad, usually the same day.

2. We reply

within the time shown on each route above.

3. You follow it

in "Your requests": status changes as the work moves.

4. We close it with you

and record what we did.

Engineering Lead · cost and delivery

SL

[Name]

Service Team lead · anything live

▼ Which route do I pick?

If it already exists and is wrong, report a problem. If it exists and you want it different, or something it depends on is changing, change something. If it doesn't exist yet, bring us something new. If you're not sure, ask a question and we'll route it.

► What makes a good candidate for something new?

► A system one of your automations uses is changing. What do you need from us?

► Will it cost my area anything?

Solution · Insurance

Claims triage

A digital worker reads every new claim notification, checks the policy, and routes the claim to the right handler queue with the facts already attached.

About this solution

Type	Digital worker
Business area	Insurance
Hero journey	Make a claim
Squad	Squad 2
Owner	[Name], Claims Operations
Live since	March 2024
Status	Live
Last reviewed	12 September 2026

What it does

- Picks up each claim notification from the shared mailbox as it arrives, around the clock.
- Finds the policy, checks cover and flags anything missing, such as a policy number.
- Routes the claim to the right handler queue with a one-line summary, so the handler starts on the decision.

What it does not do: decide whether a claim is paid. That stays with the handler.

How it is performing

Controls and evidence

Name ▾	Modified ▾	Modified by ▾
Design sign-off	12 Mar 2024	Solution Architect
Run book	2 Sep 2026	Service Team

How claims triage gave handlers back 310 hours a week

PO

[Name], Lead Product Owner · 12 September 2026 · 3 minute read

Every claim notification used to wait in a shared mailbox until someone could read it, find the policy and pass it to the right queue. Since March, a digital worker does that within minutes, around the clock.

What changed

The digital worker reads each notification, checks the policy and cover, and routes the claim with a one-line summary. Anything it can't match goes to a person with the reason attached. Handlers now start the day on decisions instead of sorting.

310 hrs

a week back to handlers

2 min

to route a claim, down from 14

£731k

value this year

My handlers start the day on decisions, not on sorting. We got back the equivalent of eight people without hiring anyone.

[Name], Claims team leader, Insurance

What's next

Missing policy numbers cause most of the claims that still need a person. We're working with the claims team on the notification form so that number is always there.
